

version.aalto.fi – Aalto Version Control System

Info & Login to the system

A new, centrally managed version control system is available for all Aalto users at <https://version.aalto.fi>

If you have any problems with the system, please contact servicedesk@aalto.fi

Aalto users are able to login to the system with Haka authentication (Picture 1). External users with HAKA account can also use the same method to access the system. External users with locally configured credentials, will have to type their credentials to the dedicated fields. Within the “Standard”, tab (Picture 2).

<input type="checkbox"/> Remember me	Forgot your password?
<input type="button" value="Sign in"/>	
Sign in with	<input type="button" value="HAKA Login"/>

Picture 2 External user login

Creating a new project

After a successful login, new user will see a welcome page (see Picture 3), where a new project can be created or an existing project can be browsed. External users cannot create new projects.

Picture 3 Welcome screen

If users want to create a new project, they will simply press the “New project” button and after that, the new project will be named, description and the privacy-settings (visibility level) of the project can be configured (see Picture 4).

The new project - screen also allows the user to import repositories from external systems, such as Github.

The screenshot shows the "New project" form. On the left, there is a heading "New project" and a sub-heading "Create or Import your project from popular Git services". The form has two input fields: "Project path" with the value "https://version.aalto.fi/" and "Project name" with the value "Testproject". Below these is a section "Import project from" with buttons for "GitHub", "Bitbucket", "GitLab.com", "Google Code", "Fogbugz", "git Repo by URL", and "GitLab export". There is a "Project description (optional)" text area with the placeholder "Description format". The "Visibility Level (?)" section has three radio button options: "Private" (selected), "Internal", and "Public". Each option has a brief description: "Private" (Project access must be granted explicitly to each user.), "Internal" (The project can be cloned by any logged in user.), and "Public" (The project can be cloned without any authentication.). At the bottom left is a green "Create project" button, and at the bottom right is a "Cancel" button.

Configuring the client for use:

In order to obtain a local copy of a repository, you will need to install a Git-client on your computer.

For centrally managed Aalto computers, The Software Self-service portal has one available, SW_Git_Aalto.

To login with Git-client (https) to a repository, use Aalto-credentials:

Username: username@aalto.fi

Password: Aalto password

Git global setup:

Configuring your username, the information can be found inside the site of a repository

(https://version.aalto.fi/your_username/repository_name)

```
git config --global user.name "your.username"
```

```
git config --global user.email "Aalto email-address"
```

Create a new repository

```
git clone http://version.aalto.fi/your_username/Testproject.git
```

```
cd Testproject
```

```
touch README.md
```

```
git add README.md
```

```
git commit -m "add README"
```

```
git push -u origin master
```

Existing folder or Git repository

```
cd existing_folder
```

```
git init
```

```
git remote add origin http://version.aalto.fi/your_username/Testproject.git
```

```
git add .
```

```
git commit
```

```
git push -u origin master
```

Size limit of a repository

Currently, the size of a repository has not been limited but avoid using the service as a storage for large files.

More information regarding the usage of GIT

For more information, how to use GIT as a version control system, feel free to familiarize yourself with the Pro Git – book composed by Scott Chacon & Ben Straub, link to the book below:

<https://git-scm.com/book/en/v2>

GitLab also provides comprehensive user guides; feel free to familiarize yourself with them at <https://version.aalto.fi/gitlab/help>
